

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended) A method for enabling the monitoring of data associated with a telecommunication user, comprising:

transmitting the data over a telecommunication network, by transmission of copies of the data to at least one listening station;

sending a copy of the data by a switching device to a monitoring handling device and is sent by the monitoring handling device to one of a number of addresses of the at least one listening stations; and

accessing a memory, using the monitoring handling device, including a list of keys for the at least one listening stations and transmitting data in encrypted form to one of the at least one listening stations using the key for the at least one listening station; wherein  
only the monitoring handling device knows the addresses of the listening stations.

2. (cancelled).

3. (previously presented) The method according to claim 1, wherein the telecommunication network is a public land mobile network.

4. (previously presented) The method according to claim 1, wherein the telecommunication network is a packet-switched network, in particular an IP protocol network.

5. (previously presented) The method according to claim 1, wherein the switching devices send the copies of the data to be intercepted to an interface switching device which knows the address of the monitoring handling device, and stores address in a memory.

6. (previously presented) The method according to claim 1, wherein the at least one listening stations have different addresses which are known to the monitoring handling device.
7. (previously presented) The method according to claim 1, wherein the monitoring handling device is located in the same network as the listening stations.
8. (currently amended) The method according to claim 1, wherein a security tunnel is set up between the monitoring handling device and the interface switching devices or will be set up to ~~monitoring~~monitor a call.
9. (currently amended) A device, comprising:
  - an interface to at least one switching device for receiving data to be intercepted;
  - a memory including a list of addresses and keys of a plurality of listening stations;
  - an interface for transmitting data in encrypted form to be intercepted from a terminal device, the data having been received by a switching device via the first interface, to an IP address of one of the listening stations, the address having been identified based on an identity of the user and the list stored in a memory in the device, wherein  
only the device knows the addresses of the listening stations.
